**“THE AMELANCHIERS”**

A very useful group of ornamental flowering trees. Well over thirty common (nonscientific) names apply. Among them are Sarvistree, Serviceberry, Shadblow, Juneberry, Downy Shadblow, Sugar Plum, May Cherry, Lancewood trees, etc.

Amelanchier can be planted as a specimen tree, either as a clump, or single stem standing alone in any choice lawn area. They often are used to ‘frame’ a home or building, by planting them at the corners, either front or rear, or at an offset with a complimentary basal planting.

In very early Spring before any leaves appear on itself or surrounding trees, Sarvistrees burst into flower. Almost every small sprig and branch appear covered with attractive, dainty, white blossoms. Sarvistrees can be observed in full flower in woodland areas all around Ohio, and give us the first breath of Spring in early April. Flowers are not subject to winter kill or frosts, or freeze damage, they are self-pollinating. Both male and female flowers are borne on the same tree.

Fruits botanically are not berries, they are ‘pomes’ or ‘little apples’. Since they are small, however, they often are called berries. Sarvistree berries bear every year, begin ripening by the end of June (hence the name Juneberry) and by early July become reddish-maroon in color, are about one quarter to one half inch in diameter, and cause the branches to bend because of their weight. Sarvistree fruits are recognized as a favorite food for just eating right off the tree, are delicious fresh frozen, or in pies, tarts, puddings, or in muffins.

The native American Indians used the Amelanchier (they called them Lancewood trees) as one of their favorite edible fruits. The fruits were harvested by the women, and were eaten fresh or dried and mixed with dried meats of several kinds (primarily buffalo) and made into a loaf (like meatloaf) and were dried and kept into the winter. They called this ‘parmesion’.

The Raymond Nelson Nursery prior to 1976, showed the following food analysis of Sarvisberries: Thiamine B-1 content, 8.16 mcg per 100 grams. (Fluorimetric Assay): Vitamin C content, 52.85 mg per 100 grams (Idometric Assay). This means that the Vitamin C content is the highest listed on tree charts, even surpassing citrus fruits.

This is probably why over 50 species of birds are attracted to eating of this fruit in June. The little pomes of the Sarvistree are the first fruits to ripen and this nourishment is an attraction, just when the birds are busy nesting and rearing their young. The National Audobon Society recommends the planting of fruit producing trees, such as the Sarvistree to attract birds.

The wood of the Sarvistree is the heaviest wood that grows in the United States outside the tropics and is equalled only by one other tree. It weighs dry 53 pounds per cubic foot. Its strength is outstanding. Its wood was used for the making of battle lances, and it was occasionally referred to as ‘lancewood’. It takes a beautiful polish. Wood technologists list the Sarvistree among the top American trees in their technical ratings of ‘modulus of rupture’, ‘resistance to indentation’ and ‘resistance to longitudinal pressure’. Sarviswood is the fifth hardest wood that grows in the United States. In resistance to breakage by ice, snow, or winds, the Sarvistree will stand unbroken long after other trees have gone down.

***Amelanchier alnifolia* 'Obelisk', PACIFIC SERVICEBERRY (10' tall)**

A clump form shrub with erect stems, growing only to 10' or so. Flowers are white, are 3/4" to 1.25" wide, appearing in erect racemes. Fruit is purplish-black, juicy and edible. Birds eat this variety last. Fruits are persistent. Zone 2-5.

Quan.	Size	Ball or Container Size	List	*Special*

1-	6 - 7'	(#5 Container)	98.00	89.00

***Amelanchier alnifolia* 'Regent', REGENT SERVICEBERRY (4-6' tall x 4-8' wide)**

A compact grower with extra sweet fruit. *Amelanchier alnifolia* is a native species in our prairie states. Was used by the native indians for food.

1-	24-30"	(#3 Container)	54.00	49.00
1-	30-36"	(#3 Container)	59.00	54.00

A close photograph of nutritious Juneberries all ready for making a pie. These tasty fruits contain more Vitamin C than any other fruits available in the United State.

***Amelanchier arborea*, DOWNY SERVICEBERRY (15-25')**

Generally referred to as the tree form of *Amelanchier canadensis*. Leaves open grayish, tomentose, densely wooly, with soft matted hairs when emerging, and change to a medium green in summer. Fall color varies from yellow to apricot-orange, with a tinge towards either deep red or lighter yellow. Some describe its color as an 'exquisite soft red'. Some landscape architects recommend its planting simply because of the beauty of their autumn foliage. **CULTURE:** Will grow almost anywhere, but prefers an acid soil. pH 4.0 to 8.0. Sun or partial shade. Zone 4.

(Trees are available as single, or as two stemmed trees, please specify if you wish two stemmed trees)

Van Wade shown here with a 'Tree Form' *Amelanchier arborea*, Downy Serviceberry in late fall.

***Amelanchier canadensis*, SHADBLOW SERVICEBERRY (15' in 20 years)**

Also called Downy Shadblow or Juneberry. The first ornamental tree to flower in early Spring. Precedes *Acer rubrum* about two weeks. When nothing else is in leaf or flower, there are the Amelanchiers, showing their racemes of small white flowers quite abundantly. Flowers are followed by grayish-green slender leaves opening 7-14 days after flowers. A see-through openly branched ornamental tree of considerable merit. Light gray-green summer foliage turns predominantly yellow with blushes of red in mid October. Medium gray bark attractively presents an informal appearance in Winter. Slow growing, a 20' tree would be about 30 years old. Prefers to grow tree form, but clumps develop by cutting back when young. Most clump forms are sold in the nursery trade are actually crossed with *Amelanchier laevis* and *grandiflora*. June bearing, maroon-purple fruit is edible. Fruits are 2/5" long, are black to maroon-purple, juicy, and are a favorite, and considered to be highly flavored and nourishing. Flavor is a cross between a plum and a blueberry, very tasty! **CULTURE:** Prefers pH of 4.0 to 6.5, but tolerates soils to 8.0. Sun or partial shade. Zone 4.

Special large specimen clumps, too large at the base to get a tree spade around, must be hand dug and hogwired. Many of our Amelanchiers over 16' are unique, many have a shape or form all of their own and lend themselves well into modern designs. Some have 3 stems, others 4, 5, or a few have 6-15 stems each, some are low branched and others are higher branched.

(Clump Form)  
in late fall.

*Amelanchier canadensis* 'Glen's Form', RAINBOW PILLAR SERVICEBERRY  
(16' tall in 20-25 years))

Plant patent #9092 - Ed Losley. Very dense and compact growth habit. Makes a beautiful specimen, compact tree. Foliage resists mildew and progresses from a nice green summer color to a rainbow of colors just before turning red during fall leaf drop. Zone 4.

Quan.	Size	Ball/Container Size	List	*Special*
3-	4 - 5' Clump	(Container)	89.00	65.00

*Amelanchier canadensis* 'Nemagazenda', NEMAGAZENDA SERVICEBERRY  
(15 tall x 6' wide in 20 years)

A Wade selection from cold-cold Ontario, Canada. Found on Gilligan's Island in Red Pine Lake on the Nemagazenda River. This windy island undergoes -40 to -60 degrees F. This selection is suspected to be of *Amelanchier canadensis* and *Amelanchier floridus* origin. Very fuzzy buds in early Spring. A good bloomer with excellent fruits. A Brian Wade selection!

We've been growing this very narrow, upright species for nearly fifteen years now. It is very hardy and has withstood our cold temperatures here very well. We have noted in growing this one, that it is very stoloniferous and new erect shoots emerge readily. We almost called it 'Fuzzy Buds', because the flower buds in January and February are almost like pussy willow fuzzy buds, except they are more pointed than on the Pussy Willows.

*Amelanchier canadensis* 'Prince William', PRINCE WILLIAM SERVICEBERRY  
(8-10' tall x 8-10' spread in 20 years)

A very compact, slow growing cultivar with suckers. Noted for its large flowers and fruit. Each pure white blossom measures nearly one inch across. Fruits are deliciously sweet, deep purple and 1/2" in diameter. Orange-red fall foliage color. Our plants seem to be very dwarf and slow to mature. Tends to be a narrower clump as a shrub. New growth tinged red and becomes glossy green. Zones 4-6.

*Amelanchier grandiflora* 'Autumn Brilliance',  
AUTUMN BRILLIANCE APPLE SERVICEBERRY

Plant patent #5717. Beautiful large flowers appear in late March before leaves. Flowers are cold hardy. They never freeze due to low elevation or Spring freezes or frosts. Leaves are disease resistant, green, turn bright red in Autumn. Fruits are relished in June by all birds and people alike. Culture: Prefers well drained soils. Tolerate some dryness, but responds well to summer additions of moisture. pH 4.0 to 6.5. Sun or shade. Zone 3.

We have been growing this selection since 1988 and find it hardy to -50 degrees below zero F. This is by far our very best Amelanchier! We have grown and planted six to eight thousand into large field grown trees spaced on 8' x 8' cross-checks.

Most Tree Form trees are headed at 3', 4', and 5' from the ground

***Amelanchier x grandiflora 'Cumulus'*, CUMULUS SERVICEBERRY**  
 (25' tall x 15' wide in 20-25 years)

Plant patent #3092. A very lovely small ornamental tree or shrub. Flowers are pure white, appear before the leaves in very early Spring. Amelanchiers are the first of all ornamental trees to bloom here. This variety usually grows into a small specimen tree rather than multi-stem as some other Amelanchiers do. Grows usually upright and has an open form of growth. Fruits are excellent to eat in June. They are blueberry type berries and can be eaten right off the tree (that is — if you can beat the robins to them). Fall color is an excellent orange-red. Culture: Prefers well drained moist soils. pH 5.0 to 6.0. Sun or partial shade. Zone 4.

We have been growing this variety since 1977 and find them very distinctive with their narrow, upright growth form. Most are all tree form. A 4 inch caliper tree matures with a 4-6' standard straight trunk, 18-21' tall and only 7-9' wide in about 15 years.

 'Forest Prince'  
 in late Fall.

*Amelanchier x grandiflora 'Princess Diana'*,

**PRINCESS DIANA SERVICEBERRY**

(20' tall x 15' wide in 25 years)

Plant patent #6041. The third member of the new Royal Family of Amelanchiers. Princess Diana is a graceful small, multi-stemmed or tree form tree with spectacular early and long lasting fall color. Fruits are 3/8" diameter. Flowers early before leaves appear in cluster. This variety grows into a small tree and is said to mature at about 18-20' and 15' wide. It is white flowering, reddish maroon fruits in June, and is distinguished primarily because of its excellent reddish fall foliage color. Its color is about the same color as Dwarf Burning Bush (*Euonymus alatus compacta*). Culture: Prefers well drained, moist soils. pH 5.0 to 6.0. Prefers sun or shade, as do all the Amelanchiers. Zone 3.

fresh picked  
basket of  
"Juneberries"!**

*Amelanchier laevis*, ALLEGHENY SERVICEBERRY (15' in 12-15 years)  
(40' in 90 years)

The most common *Amelanchier* native to Ohio today, and the most widely grown and sold species in the nursery trade. You will find this variety covered with thousands of dainty white blossoms here in our woodlands, and dotted around our homes here in early April. With the planting of this tree on a choice location as a specimen, small ornamental shade tree, or as a framework tree close by a home or residence, it will challenge the knowledge of those who observe bird identification, as they partake of its excellent June bearing, blue-black to maroon-red fruit.

Identification features that separate it from other varieties are that the leaves unfold with a tinge of red, and are slightly glabrous (wooly), as opposed to *Amelanchier canadensis*, that are only grayish-green and very wooly.

Light gray winter bark coloring is attractive. Considered to be an outstanding selection for semi-shaded areas, where an irregular, non-formal, slender branched, strongly ice and snow resistant against breakage, ornamental tree is required. *CULTURE*: Prefers 4.0 to 6.5 pH; but tolerates to 8.0. Sun or shade. Zone 4.

*Amelanchier grandiflora* 'Autumn Brilliance'  
in Autumn.

*Amelanchier grandiflora* 'Autumn Brilliance' - fall leaf color

***Amelanchier laevis 'Lustre'*, LUSTRE ALLEGHENY SERVICEBERRY**

(20-30' tall x 15-20' wide)

A new budded selection from Oregon. Grows upright and open. Very profuse grower, glowers are drooping, are white and appear in clusters in very early Spring. Leaves emerge purplish and reddish bronze, as do all of the *Amelanchier laevis* cultivars. Very edible, purplish-black fruit in June. Fall color is orange-red and holds well. A very suitable street tree or individual specimen tree. A Carlton Plant introduction.

***Amelanchier laevis 'Prince Charles'*, PRINCE CHARLES ALLEGHENY SERVICEBERRY**

(30' tall x 20' wide)

Plant patent #6039. A member of the Royal Family of *Amelanchiers* selected from *Amelanchier laevis* seedlings by Dr. Ed Hasselkus and Mr. Watson at the University of Wisconsin Arboretum and patented in 1987.

This Serviceberry grows in shade or partial shade as an understory tree. The small tree probably grows 25 to 30 feet tall and spreads 15 to 20 feet. Multiple stems are upright and highly branched forming a dense shrub, or if properly pruned a small tree. The tree is short-lived, has a rapid growth rate, and can be used as a filler plant or to attract birds. The main ornamental feature is the white flowers borne in drooping clusters in mid spring before leaf emergence. The purplish-black edible berries are sweet and juicy but are soon eaten by birds. The fall color is orange-red. It is well-adapted for planting beneath power lines.

**"BIRDS AND AMELANCHIERS"**

***The National Audobon Society recommends the planting of fruit producing trees such as the Amelanchiers. Among the species which are attracted by the Amelanchier fruits are Bluebirds, Cardinals, Chickadees, Flickers, Grosbeaks, Thrushes, Towhees, Cedar Waxwings, Jays, Mockingbirds, Orioles and Robins. The Red Winged Blackbirds, Juncos, Morning Doves, Song Sparrows, Vireos, and Warblers are not normally fruit eaters, but the quality of fruit is such that they are attracted to it.***

*Amelanchier laevis* 'Snowcloud',

**SNOWCLOUD ALLEGHENY SERVICEBERRY**

(20-30' tall x 15-20' spread)

P.P. #7203. Narrow, upright grower with wide angled branches. Large clouds of pure white flowers in early Spring. Somewhat larger, medium green foliage than *Amelanchier laevis*, very clean looking. Fruit is black and sweet. Consistent scarlet fall foliage color. Excellent disease resistance. Sun to part shade. Zone 4.

*Amelanchier laevis* 'Snow Flakes',

**SNOWFLAKES ALLEGHENY SERVICEBERRY**

(15' tall x 10' spread in 20 years)

A low headed, tree form variety. Leaves come out reddish in early Spring and turn bright green for summer foliage. Flowers resemble snowflakes, hence its name. Very floriferous! Zone 4.

2-	04-05'TF	1.25" (Container)	75.00	68.00

*Amelanchier rotundifolia* 'Edelweiss',

**EDELWEISS SERVICEBERRY**

(20-30' tall x 15-20' spread)

Definitely a shrub, upright in habit with rounded leaves which appear glaucous due to thick indumentum. Large creamy white flowers in short, erect racemes. Red fruit becomes black. Said to be more abundant flowering than the species. Zones 4-5.

12-	36-48" Clump	(Container)	64.00	58.00
1-	04-05' Clump	(Container)	75.00	68.00

*Amelanchier stolonifera*, **RUNNING SERVICEBERRY**

(15 tall x 6' wide in 20 years)

A very stoloniferous species. Native from Newfoundland through Maine and down to Virginia. Plants have stiff, upright stems; purplish-black fruit is sweet and juicy. Fruits ripen here in the second week of June. White flowers are similar to *Amelanchier canadensis*. Requires full sun and an acid soil. Zones 3-8.

**“THANKSGIVING DAY BREAKFAST TREAT”**

Freeze fresh Juneberries without adding sugar. First wash Juneberries well, drain, then freeze just as they are. Take out, thaw, and make your muffins or Juneberry Pies!

**“JUNE BERRY MUFFINS”**

1 Cup Fresh Juneberries  
2 Cups Sifted Flour  
1/3 Cup Sugar (for batter)  
1 teaspoon salt  
3 teaspoon baking powder  
1 Cup Milk  
4 tablespoons butter (melted)  
1 tablespoon sugar (for topping)  
1 teaspoon grated lemon rind  
2 fresh eggs

The fruit should be washed and dried on paper towels. Sift the dry ingredients into a large bowl; combine eggs, milk, and butter into a two-cup measure; add all at once to the flour mixture. Stir lightly just until batter is mixed (light handling is one of the secrets of fluffiness). Add berries while a bit of flour still shows; fold in gently, only a few strokes, with a fork. Spoon batter into greased muffin pan cups; filling each only about 2/3 full. Sprinkle with a mixture of 1 tablespoon sugar and lemon rind or honey. Bake in 425 degree oven 20 minutes or until golden brown.

---

**“JUNE BERRY PIE”**

1 1/2 Cups Sugar  
1/3 Cup Flour  
1/2 teaspoon lemon juice  
4 Cups Juneberries  
1 1/2 tablespoons butter

Usual directions are the same as for most other fresh berry pies. Bake in 425 degree oven for 10 minutes, then bake an additional 35 minutes at 350 degrees, or until crust is brown and juice bubbles through the slits in the top of the crust.

Note: The fruits of all Amelanchiers are called ‘Juneberries’ and can be picked in early June! If you can beat the birds to them!

*Amelanchier grandiflora*  
**'Autumn Brilliance'**  
growing in our nursery field  
in full bloom!

*Amelanchier grandiflora* 'Autumn Brilliance', 8-10' clumps dug for an order.  
Notice the pure white flowers come out just before the leaves sprout out.

**Fresh Juneberry pie is a delicious and nutritious treat! This one was baked by Steve Karbula.**

**Fresh picked Juneberries are delicious with milk and sugar or in cereals. This bowl full was picked by Van. The ripest ones are black, but even the red or lighter colored ones are very tasty!**

**Fresh Juneberry pie tastes like a cross of blueberries and Santa Rosa plums (ripe). It rivals elderberry, raspberry and blackberry pie!**

Brian Wade with a  
clump form,  
*Amelanchier canadensis*  
'Nemagazenda'.

A 1.75-2.00" caliper, tree form,  
Amelanchier with white deer guards, in  
full bloom.

A nice field of *Amelanchier grandiflora* 'Autumn Brilliance' in full bloom in Spring!
